

SETUP & ONBOARDING · FOR SHORT-STAY OPERATORS

Putting Codoo on your apartments.

An honest walkthrough of what Codoo does, what we build, what we'll need from you, and how the WhatsApp / Meta side actually works — so there are no surprises.

Codoo by KittyKat

booking.kittykat.tech

WHAT IT IS

An AI guest assistant that lives on WhatsApp.

Codoo handles the guest conversation from the booking confirmation through check-in, the stay and checkout — automatically, in the guest's own language. It sits on top of the booking channels and the WhatsApp number you already use, and brings a person in only when something actually needs one. Built end to end by KittyKat: no reseller platform between you and your guests.

HOW IT WORKS

Every answer fits that exact apartment.

Codoo uses the real check-in steps, lockbox code, Wi-Fi and parking for the guest's specific flat. If a detail isn't set, it doesn't guess — it asks you. Real problems (a breakdown, a lockout, a complaint) are escalated to you on Telegram with a short summary, and Codoo pauses itself so you and the assistant don't reply over each other.

ARCHITECTURE

Wired directly — official APIs, no middleman.

Codoo is our own hosted service. It talks straight to the official APIs — the WhatsApp Cloud API, your channel manager and the AI model — with nothing reselling or relaying your guests' messages in between.

THE STACK

Messaging	Official WhatsApp Cloud API (Graph API) — not an on-premise client, not a BSP reseller.	Inbound	App-level webhook; every payload verified by HMAC signature (X-Hub-Signature-256) and de-duplicated.
Bookings	Channel manager API (e.g. Beds24 v2), kept in sync; phone ↔ apartment mapping refreshed automatically.	AI	Large language model, called per message with the apartment context + recent conversation; prompt-cached.
State	Lightweight store for conversation memory, de-duplication and human-handoff status.	Hosting	Runs on serverless infrastructure — low latency, nothing for you to run or maintain.

Data & ownership: guest messages don't pass through a third-party chatbot SaaS — they flow through your own WhatsApp account and our service. The WhatsApp Business account and the data stay yours.

WHAT WE'LL DO TOGETHER

We build and run it. You provide access and the details.

Codoo isn't a plug-and-play app you install. It's a real integration set up per operator — so the bulk of the work is ours, and we need a few things and a little access from you to connect it to your real bookings and number.

KITTYKAT DOES

The whole build & the ongoing run.

- ✓ **Build & host the assistant**
The engine, the conversation logic, the hosting — all ours.
- ✓ **Connect the pieces**
WhatsApp Cloud API, your channel manager and the AI model, wired directly.
- ✓ **Tune tone, languages & rules**
What it answers, what it escalates, how it sounds.
- ✓ **Test & go live**
We verify end to end before any guest sees it.
- ✓ **Maintain it**
Updates, monitoring and fixes are on us.

WE'LL NEED FROM YOU

Access & the apartment details.

- **A WhatsApp number for the bot**
A dedicated number, or your existing WhatsApp Business line.
- **Meta / Facebook business access**
So we can connect the official WhatsApp Cloud API.
- **Channel manager access**
Beds24 or similar — API access to read your bookings.
- **Each apartment's details**
Check-in, lockbox code, Wi-Fi, parking, house rules — once.
- **A payment card on the WhatsApp account**
Needed only for messages the bot sends first (see next page).
- **One short joint session**
~30 min with you logged in to connect the number to Meta.

The short version: you hand over access and the apartment info once. We do the building, connecting, testing and running. After setup, you mostly just watch the Telegram group and step in when you want to.

Your number on the official WhatsApp API.

To message guests reliably, your number runs on Meta's official WhatsApp Cloud API — not a third-party reseller. That means a one-time registration with Meta. Here's exactly what it involves. We drive the technical parts; you only approve where Meta requires the account owner.

1

Meta Business + WhatsApp Business Account JOINT

A Business Manager under your company, and a **WhatsApp Business Account (WABA)** created under it to hold the number. You may already have a Business Manager; if not, we set it up with you.

2

Register the number on the Cloud API JOINT

The number is registered to the Cloud API and gets its **Phone Number ID**. Optional **Coexistence** keeps the WhatsApp Business app on the phone working alongside the API. ~30 min with you logged in.

3

App, webhook & access token KITTYKAT

A Meta app is subscribed to your WABA; inbound messages reach our **webhook**, each verified by HMAC signature (X-Hub-Signature-256). A permanent **System User token** authorises sending. All wired via the Graph API.

4

Business verification YOU PROVIDE DOCS META REVIEWS

Meta verifies the business with a company registry document. This lifts messaging limits and unlocks business-initiated messaging. A few days up to about two weeks — Meta's clock, not ours.

5

Display name & message templates WE SUBMIT META REVIEWS

For proactive messages (welcome, check-in, review), the sender display name and **UTILITY/MARKETING templates** are submitted for Meta review. Usually quick.

6

Payment method YOU

A card on the WABA covers business-initiated billing. Replies inside the **24-hour customer-service window** (guest messaged first) are free.

Your part stays small: one short session, a company document, and a card. The app, the API connection, webhook, tokens and templates are all on us — and it's a **one-time** setup per number.

Some of it is instant. One part runs on Meta's clock.

WhatsApp is owned by Meta, and Meta gates how a business can message people. Two things matter, and they switch on at different times.

Works immediately

Reactive — the guest messages first

When a guest writes to your number, a 24-hour window opens and Codoo can reply freely. This needs no Meta approval and the replies are free. This is the core of the product and it can be live quickly.

Needs Meta verification

Proactive — Codoo messages first

The "sends first" touches — a welcome on booking, a check-in reminder, a review nudge — are business-initiated. Meta requires your business to be **verified**, the message templates to be **approved**, and a **payment method** on the account. Business verification is done through Meta and can take from a few days up to about two weeks. That timeline is Meta's, not ours.

HOW A ROLLOUT TYPICALLY GOES

1

Connect

We wire up your channel manager and WhatsApp number with you.

2

Add apartments

Your flats' details go in. We test end to end.

3

Go live (reactive)

Codoo starts answering guests who message in.

4

Verification clears

Once Meta verifies the business, the proactive messages switch on.

What this means for you: Codoo can be answering your guests well before the Meta verification finishes. We start the verification early and in parallel, so the "sends first" features simply turn on the moment Meta clears it — no extra work on your side.
